Connecting to the eduSTAR Wireless
Prepared by BSC IT Department
Step by Step guide on how to connect your Windows 7 device to the Berwick SC Wireless Network

Version 1.1
1. Click on the Network Connections icon in the bottom right hand corner of the screen and select the “eduSTAR” SSID.

![Image of Network Connections]

2. Click connect.

![Image of Connect button]

3. Enter BSC\username into the “Username” field. Enter your BSC password into the “Password” field. Click “OK”. An example shown in the picture below.

![Image of Network Security]

**Note:** The username and password shown in the image are for demonstration purposes only and should not be used for actual login.
4. When you are presented with this window click “Connect”.

5. Once the wireless connection has been established, the “Set Network Location” window will appear within 1-3 minutes. When the window appears select “Work Network”.

6. Open your Internet Explorer browser.
7. Click on the tools icon which resembles a cog and select “Internet Options”.

8. Click on the “Connections” tab.
9. In the “Connections” tab click on the “LAN settings” button.

10. Uncheck the checkbox titled “Automatically detect settings” and check the checkbox titled “Use a proxy server for your LAN”
11. Enter “bsc-tmg” into the “Address:” field, enter “8080” into the “Port:” field and check the checkbox titled “Bypass proxy server for local addresses”. You can now browse the internet.

12. When you disconnect from the BSC network and connect to another network you will need to return to the “LAN Settings” window and uncheck the check box “Use a proxy server for your LAN” and recheck the “Automatically detect settings” checkbox otherwise you will not get internet access on the other network using internet explorer. Alternatively there are extensions which you can use in other browsers such as “Proxy Selector” for Firefox and “SwitchyProxy” for Chrome which can easily manage proxy connections.
